(Received on $14^{\text {th }}$ January 2012, accepted in revised form $19^{\text {th }}$ May 2012)
Summary: A new triazole compound, $\mathrm{C}_{16} \mathrm{H}_{11} \mathrm{Cl}_{2} \mathrm{~N}_{3} \mathrm{O}$, was synthesized and the crystal structure was determined by single crystal X-ray diffraction study. The crystal symmetry is monoclinic, space group P2(1)/c, with $\mathrm{a}=15.710(10) \AA, \mathrm{b}=9.969(6) \AA, \mathrm{c}=10.800(7) \AA, \alpha=90^{\circ}, \beta=103.271(11)^{\circ}, \gamma$ $=90^{\circ}$. The herbicidal activity of the title compound was determined showing a good herbicidal activity.

Keywords: Crystal structure, Synthesis, 1,2,4-triazole, Herbicidal activity.

## Introduction

In recent years, heterocycle compounds have received extensive attentions in medicinal and pesticidal chemistry field [1-5] owning to a wide range of biological activities. Notably, 1,2,4-triazole compounds play a crucial role due to their excellent pharmacological and pesticidal performances. Some of them have shown a variety of biological activities including fungicidal [6], insecticidal [7], herbicidal [8], KARI [9], anti-HIV [10] and anti-tumor activities [11], etc. The first triazolinone herbicide, namely azafenidin, was developed by Dupont in the 1970s[12], which evoked the successful invention and commercialization of a number of triazolinone derivatives for corp protections, such as amicarbazone[13], azafenidin [12], sulfentrazone[14] and carfentrazone-ethyl. These compounds are effective in being useful in $[15,16]$. We are interested in developing the novel 1,2,4-triazole compounds for herbicidal applications. Here, we report the synthesis and bioactivity of a novel 1, 2, 4-triazole derivative, namely, 4-benzyl-1-(2,4-dichlorophenyl)-3-methyl$1 H-1,2,4$-triazol-5(4H)-one, which displays good herbicidal activity against monocotyledon.

## Results and Discussion

## Chemistry and Spectroscopic Properties

Compound 3 was synthesized at $0-5{ }^{\circ} \mathrm{C}$ Compound 4 was prepared according to the known procedure [8]. The molecular structures of all the intermediates and target compounds were analyzed by ${ }^{1} \mathrm{H}$ NMR spectroscopy, infrared spectroscopy (FTIR), elemental analysis as well as single crystal X-ray diffraction analysis. Based on the ${ }^{1} \mathrm{H}$ NMR spectrum of the title compound, the $\mathrm{CH}_{2}$ proton signals appear
at as a singlet at 4.91 ppm . The two methyl groups appear as two singlets at $\delta 2.10 \mathrm{ppm}$ and 2.37 ppm , respectively. The IR spectrum of the title compound shows an absorption band at $1711 \mathrm{~cm}^{-1}$, which is assigned as the characteristic stretching vibration signal of the carbonyl $(\mathrm{C}=\mathrm{O})$ functional group. The signal of $\mathrm{C}=\mathrm{N}$ double bonds appeared at a wave number of $1583 \mathrm{~cm}^{-1}$.

## Crystal Structure

The molecular structure and unit cell crystal packing of the compound are presented in Fig. 1 and 2 respectively. The atomic coordinates and equivalent isotropic displacement parameters are shown in Table-1. The selected bond lengths, bond angles and torsion angles of the title compound are listed in Table- $\mathbf{2}$ and $\mathbf{3}$ respectively [17-19]

Fig. 1: Molecular structure of the title compound, showing displacement ellipsoids drawn at the $30 \%$ probability level.

Table-1: Atomic coordinates $\left(\times 10^{4}\right)$ and equivalent isotropic displacement parameters $\left(\mathrm{A}^{2} \times 10^{3}\right)$ for title compound. $\mathrm{U}(\mathrm{eq})$ is defined as one third of the trace of the orthogonalized Uij tensor.

In general, the average bond lengths and bond angles of the ring systems (phenyl and triazole) are within the normal ranges [17-19]. However, it is observed that the $\mathrm{C} 7-\mathrm{N} 1$ bond $[1.37 \AA$ ] is shorter than the normal C-N single bond (1.47 $\AA$ ), which indicates a conjugation effect formed between C7-N1
bond with neighboring $\mathrm{N} 2=\mathrm{C} 8$ double bond. The bond length of $\mathrm{C} 7=\mathrm{O} 1$ (Table-1) is in agreement with other $\mathrm{C}=\mathrm{O}$ counterparts existing in 1,2,4-triazole ring. From Table 3, the torsion angles of these rings are close to $0^{\circ}$ or $180^{\circ}$ respectively. The torsion angles of C6-N1-N2-C8, N2-N1-C7-O1 are close to $180^{\circ}$. The torsion angles of C7-N1-N2-C8, C1-C2-C3-C4 is close to $0^{\circ}$.

The triazole ring defined by $\mathrm{N} 1, \mathrm{~N} 2, \mathrm{C} 8$, N3, C7 is rather planar. The least squares plane equation based on these atoms is $7.652 \mathrm{x}+-0.822 \mathrm{y}$ $+7.171 \mathrm{z}=2.0855(0.676 x+5.675 y+17.711 \mathrm{z}=$ $4.5981 ;-0.456 \mathrm{x}+7.879 \mathrm{y}+2.148 \mathrm{z}=2.8182)$, with a largest deviation of $0.0048 \mathrm{~nm}(0.0013 \mathrm{~nm}$ and 0.0031 nm ). Meanwhile, the triazole ring is almost perpendicular to both phenyl rings, which is revealed by the corresponding dihedral angle of $97.4^{\circ}$ and $40.1^{\circ}$.

A: Postmergence, B: Premergence, nd: not determined.

## Herbicidal Activity

The postemergence and premergence herbicidal activities of the title compound were tested in a greenhouse at the concentration of 1500 g per a.i./ha. Carfentrazone-ethyl, a triazolinone-type commercial product, was used as the control. The primary bioassay shows that the title compound exhibits an excellent inhibiting activity towards Echinochloa crusgalli (L.) Beauv., Digitaria adscendens, Brassica napus, Amaranthus retroflexus. Under the postmergence, its inhibition rates to Echinochloa crusgalli (L.) Beauv., Digitaria adscendens, Brassica napus, Amaranthus retroflexus reach $93.7 \%, 100 \%, 28.8 \%$ and $100 \%$ respectively at a concentration of $1500 \mathrm{~g} / \mathrm{ha}$. But it didn't show appreciable herbicidal activities against Echinochloa crusgalli (L.) Beauv., Digitaria adscendens, Brassica napus, Amaranthus retroflexus under premergence. By comparison of the herbicidal activities listed in Tables-4, it is concluded that the title compound $\mathbf{4}$ is less effective than the commercial herbicide
carfentrazone-ethyl at the dosage of $600,300,150 \mathrm{~g}$ of a.i./ha in postemergence treatment.

## Experimental

## Materials and Methods

2,4-dichloroaniline were purchased from Nanjing Tianzun Zezhong Chemical Co., Ltd with $>95 \%$ purity confirmed by high-performance liquid chromatography (HPLC). Other reagents are of analytical grade. Melting points were determined using an X-4 apparatus and uncorrected. ${ }^{1} \mathrm{H}$ NMR spectra were measured on a Bruker AC-P500 instrument $(300 \mathrm{MHz})$ using TMS as an internal standard and $\mathrm{CDCl}_{3}$ as the solvent. Elemental analyses were performed on a Vario EL elemental analyzer. Crystallographic data of the compound were collected on a Bruker SMART 1000 CCD diffractometer.

## General procedure

Scheme 1: The synthetic route of title compound.

## Synthesis of 3a-3c and $\mathbf{4}$

To solution of 2,4-dichloroaniline-hydroc-hloride ( $15 \mathrm{~g}, 92.5 \mathrm{mmol}$ ) in water ( 3 mL ) and concentrated hydrochloric acid ( 100 mL ) was added a solution of sodium nitrite ( $7.038 \mathrm{~g}, 102$ mmol ) in water ( 50 mL ) dropwise during 15 min under ice-bath cooling. The reaction mixture was stirred for 1 h . Then a solution of tin(II) chloride ( 52 $\mathrm{g}, 231 \mathrm{mmol}$ ) in concentrated hydrochloric acid ( 50 mL ) was added dropwise. After 1.5 h a bulky precipitate was collected by filteration and recrystallized from ethanol to give 2,4dichlorophenylhydrazine hydrochloride. Next, the aqueous solution of this compound was neutralized by adding NaOH aqueous solution $\mathrm{pH}=9 \sim 10$. The precipitation was formed during this course and collected by filteration. The product was further dried in vacuo. M.p. $93 \sim 94^{\circ} \mathrm{C}$ (ref. $94^{\circ} \mathrm{C}$ [20]). ${ }^{1} \mathrm{H}$ NMR ( $\delta$, $\mathrm{CDCl}_{3}$ ): 7.07-7.24 (m, $\left.\mathrm{PhH}, 3 \mathrm{H}\right), 5.70(\mathrm{br}, 1 \mathrm{H}, \mathrm{NH})$, 3.61 (br, $2 \mathrm{H}, \mathrm{NH}_{2}$ ).

To solution of 2,4dichlorophenylhydrazine $(2 \mathrm{~g}, 0.019 \mathrm{~mol})$ in tert-butyl alcohol and water ( $\mathrm{V} / \mathrm{V}=9: 1$ ), $40 \%$ acetaldehyde $(17 \mathrm{~g}, 160 \mathrm{mmol})$ was added dropwise under ice-water bath cooling. After stirring for 5 min , sodium cyanate $(9.2 \mathrm{~g}, 140.9 \mathrm{mmol})$ was added. Subsequently, acetic acid ( $9.3 \mathrm{~g}, 155.0 \mathrm{mmol}$ ) was added dropwise during 15 min . The resulting reaction mixture was stirred at $20^{\circ} \mathrm{C}$ for 3 h . Next, a $10 \%$ aqueous solution of sodium hypochlorite ( $11.8 \mathrm{~g}, 159.0 \mathrm{mmol}$ ) was added during 40 min . Then the reaction mixture was stirred for another 2 h . After removing tert-butyl alcohol and water were on a rotary evaporator, a red residue was afforded which was further recrystallised from acetic ether and petroleum ether. The pure product was obtained as a white crystal. Mp. 188-190 ${ }^{\circ} \mathrm{C}$ (ref.190$\left.192^{\circ} \mathrm{C}[20]\right) .{ }^{1} \mathrm{H}$ NMR ( $\delta, \mathrm{CDCl}_{3}$ ): $11.49(\mathrm{br}, 1 \mathrm{H}, \mathrm{NH})$, 7.35-7.55 (m, $\mathrm{PhH}, 3 \mathrm{H}), 2.28\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$ 。

To a mixture of 2-(2,4-Dichlorophenyl)-

5-methyl-2,4-dihydro-1,2,4-triazol-3-one ( $0.50 \mathrm{~g}, 2.0$ mmol ) and anhydrous potassium carbonate ( 0.35 g , 2.5 mmol ) in dimethylformamide ( $\mathrm{DMF}, 10 \mathrm{~mL}$ ), benzyl chloride ( $0.46 \mathrm{~g}, 2.1 \mathrm{mmol}$ ) in DMF ( 2 ml ) was added dropwise. The mixture was stirred at room temperature for 2 h . Then $\mathrm{CH}_{2} \mathrm{Cl}_{2}(30 \mathrm{~mL})$ was added and the organic layer was separated, washed with water, and the solvent was then evaporated under the reduce pressure to afford compound 4(yield 0.79 g , $90 \%$, m.p. $157-158^{\circ} \mathrm{C}$ ).

4-benzyl-1-(2,4-dichlorophenyl)-3-methyl$1 H-1,2,4$-triazol- $5(4 H)$-one 4 : white crystal, yield, 87.1\%; mp, 76-77 ${ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right), \delta 7.56(\mathrm{~m}$, $\mathrm{PhH}, 1 \mathrm{H}), 7.37(\mathrm{~m}, \mathrm{PhH}, 2 \mathrm{H}), 2.73\left(\mathrm{~s}, \mathrm{CH}_{3}, 3 \mathrm{H}\right), 2.56$ (s, $\mathrm{CH}_{3}, 3 \mathrm{H}$ ). Anal. Calcd for $\mathrm{C}_{16} \mathrm{H}_{13} \mathrm{Cl}_{2} \mathrm{~N}_{3} \mathrm{O}$ (\%): C, 57.50; H, 3.92; N, 12.57. Found: C, 57.58; H, 3.89; N, 12.62.

## Crystal Structure Determination

The prism-shaped single crystal of the title compound was obtained by recrystallization from EtOH. The crystal with dimensions of 0.28 mm $\times 0.24 \mathrm{~mm} \times 0.20 \mathrm{~mm}$ was mounted on a Bruker SMART 1000 CCD area-detector diffractometer with a graphite-monochromated $\mathrm{MoK} \alpha$ radiation ( $\lambda=$ $0.71073 \AA$ ) by using a Phi scan modes at 294(2) K in the range of $1.3^{\circ} \leq \theta \leq 25.0^{\circ}$. A total of 7713 reflections were collected, of which 2851 were independent ( $R_{\text {int }}$ $=0.118)$ and 1354 were observed with $\mathrm{I}>2 \sigma(\mathrm{I})$. The calculations were performed with SHELXS-97 program [21] and the empirical absorption corrections were applied to all intensity data. The non-hydrogen atoms were refined anisotropically. The hydrogen atoms were determined with theoretical calculations and refined isotropically. The final full-matrix least squares refinement gave $\mathrm{R}=$ 0.0782 and $\mathrm{wR}=0.2059 \quad\left(w=1 /\left[\mathrm{s}^{2}\left(F_{o}{ }^{2}\right)+\right.\right.$ $\left.\left.(0.0286 P)^{2}\right]\right]$, where $P=\left(F_{o}{ }^{2}+2 F_{c}{ }^{2}\right) / 3, \mathrm{~S}=0.88$, $(\Delta / \sigma)_{\max }=0.0020, \Delta \rho_{\text {max }}=0.49$ and $\Delta \rho_{\text {min }}=-0.31 \mathrm{e}$ $\AA^{-3}$. Atomic scattering factors and anomalous dispersion corrections were taken from International Table for X-Ray Crystallography [22]. A summary of the key crystallgraphic information were given in Table-5.

Table-5: Crystal data of the title compound.

| Empirical Formula | $\mathrm{C}_{16} \mathrm{H}_{41} \mathrm{Cl}_{2} \mathrm{~N}_{3} \mathrm{O}$ |
| :---: | :---: |
| Formula weight | 332.18 |
| T/K | 294(2) |
| $\lambda / \mathrm{nm}$ | 0.071073 |
| Crystal system, space group | Monoclinic, P2(1)/c $a=15.710(10) \AA \quad \alpha=90^{\circ}$ |
| Unit cell dimensions | $\begin{aligned} & b= 9.969(6) \AA \quad \beta=103.271(11)^{\circ} \\ & c=10.800(7) \AA \quad \gamma=90^{\circ} \end{aligned}$ |
| $V / \mathrm{nm}^{3}$ | $1646.3(18) \AA^{3}$ |
| $\boldsymbol{Z}$ | 4 |
| Calculated density/( $\mathrm{g}^{*} \mathrm{~cm}^{-3}$ ) | 1.340 |
| Absorption coefficient/ $\mathrm{mm}^{-1}$ | 0.398 |

## Herbicidal Activities

Method of the Pot Culture (glasshouse tests)
Pre-emergence: Sandy clay ( 100 g ) in a plastic box $(11 \times 7.5 \times 6 \mathrm{~cm})$ was wetted by water. Then the sprouting seeds ( 15 grains) of the weed were planted with fine earth ( 0.6 cm depth) covered in glasshouse. Spraying the solution of the compound evaluated in the suitable solvent was carried out at the rate of $1,500 \mathrm{~g} / \mathrm{ha}$.

Post-emergence: Spraying the same solution of the compound evaluated on the seedlings (one leaf and one core) of the weed was carried out at the same rate of pre-emergence.

For both methods, fifteen days later, the fresh weights were weighed and the percentage of the inhibition was calculated.

## Supplementary Material

CCDC-832506 contains the supplementary crystallographic data for this paper. These data can be obtained free of charge at www.ccdc.cam.ac.uk/conts/retrieving.html or from the Cambridge Crystallographic Data Centre, 12 Union Road, Cambridge CB2 1EZ, UK; fax: +44-1223-336033; e-mail: deposit@ccdc.cam.ac.uk.
